Solar With Philip

CALIFORNIA ENERGY COST AWARENESS

Look at What You Are Paying for Now and the Cost of Not Changing

Electricity supports more than what happens inside one home.
The larger system must generate, move, protect, balance and reliably deliver power.

A more informed California is a stronger California.

01

WHAT DRIVES ELECTRICITY COSTS?

Demand, aging infrastructure, wildfire protection, transmission, storage and reliability all shape the system behind the outlet.

02

USING LESS DOES NOT LOCK THE PRICE

You control how much electricity you use. You do not control every future price, charge, or rate structure applied to what you still buy.

03

ELECTRICITY IS BECOMING MORE IMPORTANT

Transportation, home comfort, connected life, business, data centers and technology are increasing society's dependence on electricity.

04

THE COST AFFECTS MORE THAN ELECTRICITY

Energy competes with retirement income, groceries, transportation, savings, housing comfort and business expenses.

A REAL QUESTION

Do I want to remain completely exposed to future electricity costs, or do I want some level of control over them?

No one can know one exact future price. The point is to understand the exposure clearly enough to make informed choices.

THE INFORMED HOMEOWNER MOVEMENT

Awareness Should Be Shared, Not Sold

Californians should help one another understand the costs, risks, contracts, assumptions, and long-term choices connected to home energy.

HELP ONE MORE PERSON BECOME INFORMED

Better information. Better questions. Better decisions.
